

1. Angular Usage: Utilize any Angular version greater than 2 - 11 for the web development, demonstrating a good understanding of its features and best practices.
2. Hotel Search Component:
Create a component that allows users to search for hotels by name.
Implement a search input field and a "Search" button.
Display a list of 200 hotels, allow user to scroll with lazy loading or implement pagination with default page size as 20.
3. Hotel name should be hyperlink in search result, on click of it, it should redirect you to the Home page as shown below:

4. Components:
 - Hotel Left Panel:**
 - Image Section, hotel provider(ex: Taj Hotels)
 - Address section**
 - Street, state, country, pincode
 - Email
 - Phone number
 - On click of edit button allow user to alter the data.

Basic info section

Short Name
Id
Hotel type
Default Currency
Location

On click of edit button allow user to alter the data.

Right Panel should have top panel of menus:

Home
About
Classification
Products
Terms
Finance
Notes

By Default Home menu should be shown.

Widgets to show below details:

Date on which the service was Last Used
Upcoming Confirmed booking count
Upcoming OnRequest booking count
Next Booking Date
Open & Total complaint count
Total amount To Be paid

Booking Overview: This should save a bar graph of number of bookings in current year monthwise.

Map Component: based on latitude, longitude value of the service show the service location in map view.

Routing:

Configure routing to navigate between the service search result & home tab.

Styling:

Apply basic styling to the application using CSS to ensure a clean and user-friendly UI.

Following items are expected to be implemented in the above assignment.

5. Kindly create a json file based on the data you need to display on these pages and use that as your mock data.
6. Route Resolver: Implement a route resolver to fetch data before rendering the Service Component, ensuring that data is available before navigation.

7. TypeScript: Ensure that the candidate uses TypeScript throughout the project
8. Asynchronous Calls: Handle asynchronous API calls using promises or RxJS Observables, showcasing proficiency in managing async operations in JavaScript.
9. Error Handling: Implement error handling mechanisms to handle failed API requests gracefully and provide appropriate feedback to users.
